## ALIGNMENTS

Botulinum toxin; neurotoxin; BoBT/F; immunogen; vaccine; botulism. Immunogenic type F botulinum toxin polypeptide (aa848-991). Pasechnik VA; Clostridium botulinum; type F strain Langeland Mauchline ML, Minton NP, (MICR-) MICROBIOLOGICAL RES AUTHORITY AAW09015 standard; protein; 144 AA. 95GB-00011909. (first entry) (revised) 12-JUN-1996; 12-JUN-1995; WO9641881-A1 27-DEC-1996. 17-OCT-2003 31-MAR-1997 Elmore MJ, AAW09015; AAW09015

WPI; 1997-065467/06.

Immunogenic type F botulinum toxin polypeptide(s) - allows recombinant vaccine prodn.

Claim 5; Page 17-18; 37pp; English.

Novel polypeptides (AAM09014-17) respectively comprise amino acids 848-1278, 848-991, 992-1135 and 1136-1278 in the heavy chain of a type F botulinum neurotoxin (BoMT/F). They lack the L chain and HN epitopes necessary for metalloprotease activity and toxin internalisation. They are free of botulinum toxin activity but can induce protective immunity to a type F botulinum toxin, making them useful for vaccine produced Recombinant polypeptides can be produced in transformed host cells, as fusion proteins, e.g. with malcose binding protein to facilitate purification. (Updated on 17-OCT-2003 to standardise OS field)

                                                                        9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             of a type P botulinum neurotxin (BONT/F), and can be produced using a synthetic gene (AAT48101) based on the natural gene sequence (AAT48100) for the heavy chain. The polypeptides and its fragments (see also AAW09015-17) lack the light chain and HN epitopes necessary for metalloprotease activity and toxin internalisation. They are free of botulinum toxin, making them useful for vaccine prodn. Recombinant polypeptides can be produced in transformed host cells, esp. as fusion proteins, e.g. with maltose binding protein to facilitate purification. (Updated on 17-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Immunogenic type F botulinum toxin polypeptide(s) - allows recombinant vaccine prodn.

Botulism neurotoxins are translated as a single 150 kDa polypeptide chain and then posttranslationally nicked, forming a dichain consisting of a condition heavy chain and a 50 kDa light chain which remain linked by a clisulfide bond. Nucleic acide encoding the carboxy-terminal (HC) or amino terminal (HN) portion of the heavy chain of botulinum neurotoxin (BoNT) can be used in recombinant expression vectors and expressed in transformed cells to produce peptide antigens useful for eliciting an immune response to give protective immunity against botulinum neurotoxin, thich causes botulism. The nucleic acide are expressible in a recombinant ocombinant nucleic acide are advantageous since it eliminates the need coupling the production yield from the genetically engineered product is also high and cost of production is lower. The nucleic acide can be derived from the cost of production is lower. The nucleic acide can be derived from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New nucleic acids encoding the carboxy- or amino-terminal portions of the heavy chain of botulinum neurotoxin of serotype A-G, useful as vaccine

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Botulism neurotoxins are translated as a single 150 kDa polypeptide chain

and then posttranslationally nicked, forming a dichain consisting of a

100 kDa heavy chain and a 50 kDa light chain which remain linked by a

disulfide bond. Nucleic acids encoding the carboxy-terminal (HC) or amino

terminal (HN) portion of the heavy chain of botulinum neurotoxin (BoNT)

can be used in recombinant expression vectors and expressed in

transformed cells to produce peptide antigens useful for eliciting an

immune response to give protective immunity against botulinum neurotoxin,

which causes botulism. The nucleic acids are expressible in a recombinant

organisms such as Eschérichia coli or Pichia pastoris. The use of

recombinant nucleic acids are advantegeous since it aliminates the need

to culture large quantities of hazardous toxin-producing bacterium.

Production yield from the genetically engineered product is also high and

cost of production is lower. The nucleic acids can be derived from

```
The invention relates to a non toxic polypeptide, for delivery of a therapeutic agent to a neuronal cell, which comprises a binding domain (carboxy terminal half of heavy chain (HC) of a neurotoxin, designated as HC) that binds to the neuronal cell and a translocation domain (amino terminal half of HC, designated as HN), that translocates the therapeutic agent into the neuronal cell, where the translocation domain is not a HN domain of a clostridial neurotoxin and is not a fragment or derivative of a HN domain of a clostridial toxin. Polypeptides of the invention are useful for the treatment of a disease state associated with neuronal cells. They are useful for delivering therapeutic substances to neuronal cells. They are useful to treat disorders of the CNS including neurodegenerative diseases, stroke, epilepsy, brain tumours

   and infection. They are also useful in gene therapy. The present sequence is a modified clostridial heavy chain fragment. This sequence is constructed by fusing the binding domain of botulinum neurotoxin type F (BONT/F) with translocation domain of diphtheria neurotoxin. (Updated on 11-SEP-2003 to standardise OS field)

```

The invention relates to a conjugate comprising an injected bacterial effector protein and a carrier that targets the effector protein to a target cell. Pharmaceutical composition of the invention is useful for treatment selected from proming or inhibiting survival of cells; preventing and reversing damage to cells; killing cells; promoting or inhibiting the growth of cells, apoptosis, release of an inflammatory

```
mediator from cells, division of cells and treating intracellular infection and regulating nitric oxide release from cells. The invention is useful in the manufacture of a medicament for treating a neuronal cell, for intracellular infection, for interfering with intracellular tracellular infection, for interfering with intracellular trafficking, for modulating expression of cell-surface markers and for inhibiting secretion from cells. The invention is also useful for treating prion disease, Alzheimer disease and wide range of disorders inhibiting secretion disorders such as blephorospasm, torticolis and prion disorders such as chronic obstructive pulmonary disease (COPD), bronchitis and aschma. The present sequence is a fusion construct comprising Corynebacterium diphtheria diphtheria toxin translocation domain (Dip-HN domain) and botulinum type F neurotoxin from Clostridium botulinum. This sequence is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                             ö

                                                                                                                                                                                                                                                                                                                                                                   hypersecretion disorders such as chronic obstructive pulmonary disease (COPD), bronchitis and asthma. The present sequence is a fusion construct comprising Corynebacterium diphtheriae diphtheria toxin translocation domain (DipT-HW domain), botulinum type F neurotoxin binding domain (BONT/F-Hc) from Clostridium botulinum and thrombin linker peptide. This sequence is used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        GIYSSKPSEVNIAQNNDIIYNGRYQNFSISFWVRIPKYFNKVNLNNEYTIIDCIRNNNSG 120
                                                  The invention relates to a conjugate comprising an injected bacterial effector protein and a carrier that targets the effector protein to a target cell. Pharmaceutical composition of the invention is useful for a treatment selected from promoting or inhibiting survival of cells, preventing and reversing damage to cells, killing cells, promoting or inhibiting the growth of cells, apoptosis, release of an inflammatory mediator from cells, division of cells and treating intracellular infection and regulating nitric oxide release from cells. The invention is useful in the manufacture of a medicament for treating a neuronal cell, for intracellular infection, for interfering with intracellular trafficking, for modulating expression of cell-surface markers and for the interfering expression of cell-surface markers and for the control of the control of cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            infection; Prion disease; Alzheimer' disease; hypersecretion disorder; muscle appasm; CODP; bronchitis; chronic obstructive pulmonary disease; torticolis; blephorospasm; asthma; fusion protein; diphtheria toxin; BONT/F; translocation domain; HN domain; DipT; Hc; binding domain;
                                                                                                                                                                                                                                                                                                    inhibiting secretion from cells. The invention is also useful for treating Prion disease, Alzheimer' disease and wide range of disorders including muscle spasms such as blephorospasm, torticolis and

The invention relates to a conjugate comprising an injected bacterial effector protein and a carrier that targets the effector protein to a target cell. Pharmaceutical composition of the invention is useful for a treatment selected from promoting or inhibiting survival of cells; preventing and reversing damage to cells; killing cells; promoting or inhibiting the growth of cells, apoptosis, release of an inflammatory compliance from cells, division of cells and treating intracellular infection and regulating nitric oxide release from cells. The invention is useful in the manufacture of a medicament for treating a neuronal cell; for intracellular infection, for interfering with intracellular crafficking, for modulating expression of cell-surface markers and for inhibiting secretion from cells. The invention is also useful for crafficking, for modulating expression of cell-surface markers and for inhibiting secretion from cells. The invention is also useful for craticals grams such as blephorospasm, torticolis and including muscle spasms such as blephorospasm, torticolis and comprising corpusabacterium diphtheriae diphtheria toxin translocation comprising comprising corpusabacterium diphtheriae diphtheria toxin translocation comprising more comprising more comprising corpusabacterium diphtheriae diphtheria toxin translocation comprising corpus for construction of the invention general construction comprises the comprision of the invention of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       287 GIYSSKPSEVNIAQNNDIIYNGKYQNFSISFWVRIPKYFNKVNLNNEYTIIDCIRNNNSG 346
                                                                                                            LUNJUGATE TOT MODULATING CEll SURVIVAL AND CELL GROWTH, MODULATING release of inflammatory mediator from cells, comprises injected bacterial effector protein and a carrier that targets the protein to target cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  tumour; infection; neurodegenerative disease; gene therapy; chimeric; diphtheria neurotoxin; tetanus neurotoxin; TeNT; botulinum neurotoxin type F; BONT/F.

the invention relates to a non toxic polypeptide, for delivery of a therapeutic agent to a neuronal cell, which comprises a binding domain (carboxy terminal half of heavy chain (HC) of a neurotoxin, designated as HC) that binds to the neuronal cell and a translocation domain (amino terminal half of HC, designated as HN), that translocates the therapeutic agent into the neuronal cell, where the translocation domain is not a HN domain of a clostridial neurotoxin and is not a fragment or derivative of a HN domain of a clostridial toxin. Polypeptides of the invention are useful for the treatment of a disease state associated with neuronal cells. They are useful for delivering therapeutic substances to neuronal cells. They are useful to treat disorders of the constructed and infection. They are also useful in gene therapy. The present sequence is and infection. They are also useful in gene therapy. The present sequence is modified clostridial heavy chain fragment. This sequence is constructed by fusing the binding domain which is a hybrid of botulinum neurotoxin type F (BoNY/F) and tetanus neurotoxin (Updated on 11-SEP-2003 to translation) and the construction domain of diphtheria neurotoxin. (Updated on 11-SEP-2003 to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                    New non toxic polypeptide for delivery of a therapeutic agent for the treatment of a CNS disorder comprising a binding domain that translocates the therapeutic agent into the neuronal cells.

The invention relates to a non toxic polypeptide, for delivery of a therapeutic agent to a neuronal cell, which comprises a binding domain (carboxy terminal half of heavy chain (HO) of a neurotoxin, designated as HO) that binds to the neuronal cell and a translocation domain (amino terminal half of HC, designated as HN), that translocates the therapeutic agent into the neuronal cell, where the translocation domain is not a HN domain of a clostridial neurocxin and is not a fragment or derivative of a HN domain of a clostridial neurocxin and is not a fragment or derivative of useful for the treatment of a disease state associated with neuronal cells. The polypeptide constructs are useful for delivering therapeutic substances to neuronal cells. They are useful to treat disorders of the CNS including neurodegenerative diseases, stroke, epilepsy, brain tumours
                                                                                                                                                                                                                                                                                                                                                                                                                 New non toxic polypeptide for delivery of a therapeutic agent for the treatment of a CNS disorder comprising a binding domain that translocates the therapeutic agent into the neuronal cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             and infection. They are also useful in gene therapy. The present sequence is modified clostridial heavy chain-superoxide dismutase conjugate. This conjugate comprises bacterial Mn-superoxide dismutase (MnSOD), from Bacillus stearothermophilus, linker that can be cleaved by factor Xa, translocation peptide from influenza virus and a neuronal cell-specific binding domain from botulinum neurotoxin type F (BONT/F)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             315 GIYSSKPSEVNIAQNNDIIYNGRYQNFSISFWVRIPKYFNKVNLNNEYTIIDCIRNNNSG 374

The invention relates to a non toxic polypeptide, for delivery of a therapeutic agent to a neuronal cell, which comprises a binding domain (actorioxy terminal half of heavy chain (HC) of a neurotoxin, designated as HC) that binds to the neuronal cell and a translocation domain (amino terminal half of HC, designated as HN), that translocates the therapeutic agent into the neuronal cell, where the translocation domain is not a HN domain of a clostridial neurotoxin and is not a fragment or derivative of a HN domain of a clostridial toxin. Polypeptides of the invention are cells. The polypeptide constructs are useful for delivering therapeutic substances to neuronal cells. They are useful to treat disorders of the cost infection. They are also useful in gene therapy. The present sequence and infection. They are also useful in gene therapy. The present sequence is modified clostridial heavy chain-superoxide dismutase conjugate. This conjugate compities bacterial hn-superoxide dismutase (MNSO), from the second conjugate of the conjugate of the conjugate of the conjugate of the conjugate of the conjugate of the conjugate of the conjugate of the conjugate of the conjugate of the conjugate of the conjugate of the conjugate of the conjugate of the conjugate of the conjugate of the conjugate of the conjugate of the conjugate of the conjugate of the conjugate of the conjugate of the conjugate of the conjugate of the conjugate of the conjugate of the conjugate of the conjugate of the conjugate of the conjugate of the conjugate of the conjugate of the conjugate of the conjugate of the conjugate of the conjugate of the conjugate of the conjugate of the conjugate of the conjugate of the conjugate of the conjugate of the conjugate of the conjugate of the conjugate of the conjugate of the conjugate of the conjugate of the conjugate of the conjugate of the conjugate of the conjugate of the conjugate of the conjugate of the conjugate of the conjugate of the conjugate of the conjugate of the conjugate of the conjugate of the conjug
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     491
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         61 GIYSSKPSEVNIAQNNDIIYNGRYQNPSISFWVRIPKYFNKVNLNNEYTIIDCIRNNNSG 120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New non toxic polypeptide for delivery of a therapeutic agent for the treatment of a CNS disorder comprising a binding domain that translocates the therapeutic agent into the neuronal cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       9

RESULT 12

```
The invention relates to a non toxic polypeptide, for delivery of a therapeutic agent to a neuronal cell, which comprises a binding domain carboxy terminal half of heavy chain (HT) of a neurotoxin, designated as HC (carboxy terminal half of the neuronal cell and a translocation domain (amino terminal half of HC, designated as HN), that translocation domain is not a HN agent into the neuronal cell, where the translocation domain is not a HN domain of a clostridial toxin. Polypeptides of the invention are useful for the treatment of a disease state associated with neuronal cells. The polypeptide constructs are useful to delivering therapeutic substances to neuronal cells. They are useful to treat disorders of the CNS including neurodegenerative diseases, stroke, epilepsy, brain tumours and infection. They are also useful in gene therapy. The present sequence is modified clostridial heavy chain-superoxide dismutase (MmSOD), MnSOD from Bacillus steasortheramphilus, linker that can be cleaved by thrombin, translocation domain from diphtheria neurotoxin and a neuronal cell-specific binding domain from botulinum neurotoxin type F (BONT/F)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New non toxic polypeptide for delivery of a therapeutic agent for the treatment of a CNS disorder comprising a binding domain that translocates the therapeutic agent into the neuronal cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               516

The invention relates to a conjugate comprising an injected bacterial effector protein and a carrier that targets the effector protein to a target cell. Pharmaceutical composition of the invention is useful for a treatment selected from promoting or inhibiting survival of cells; contains the promoting or inhibiting survival of cells; promoting or inhibiting the growth of cells, apoptosis, release of an inflammatory mediator from cells, division of cells and treating intracellular mediator from cells, division of cells and treating intracellular infection and regulating mitric oxide release from cells. The invention cell, for intracellular infection, for interfering with intracellular cell, for intracellular infection of cell-surface markers and for trafficking, for modulating expression of cell-surface markers and for treating Prion disease, Alzheimer' disease and wide range of disorders including muscle spamms such as chronic obstructive pulmonary disease comprising corpression disorders such as chronic obstructive pulmonary disease comprising corpressorerium diphtheriae diphtheria toxin translocation comprising corpressorerium diphtheriae diphtheria toxin translocation (BONI/P-HC) from Clostridium botulinum and factor Xa linker peptide and Yersinia peetls targeted effector protein YopT. This sequence is used in the exemplification of the invention
Conjugate for modulating cell survival and cell growth, modulating release of inflammatory mediator from cells, comprises injected bacterial effector protein and a carrier that targets the protein to target cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           BONT/F-Hc-DipT HN domain-factor Xa linker-YopT protein fusion construct.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Apoptosis; therapy; inflammatory mediator; intracellular trafficking; infection; Prion disease; Alzheimer' disease; hypersecretion disorder; muscle spasm; CODD, bronchitis; chronic obstructive pulmonary disease; torticolis; blephorospasm; asthma; fusion protein; diphtheria toxin; BONT/F; translocation domain; HN domain; Dipf; HC; binding domain; botulinum type F neurotoxin; targetted effector protien; YopT.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Example 12; Page 110-114; 130pp; English

```
The invention relates to a non toxic polypeptide, for delivery of a therapeutic agent to a neuronal cell, which comprises a binding domain (carboxy terminal half of heavy chain (HC) of a neurotoxin, designated as HC) that binds to the neuronal cell and a translocation domain (amino terminal half of HC, designated as HN), that translocates the therapeutic agent into the neuronal cell, where the translocation domain is not a HN domain of a clostridial neurotoxin and is not a fragment or derivative of a HN domain of a clostridial toxin. Polypeptides of the invention are useful for the treatment of a disease state associated with neuronal cells. They are useful for delivering therapeutic substances to neuronal cells. They are useful to treat disorders of the CNS including neurodegenerative diseases, stroke, epilepsy, brain tumours and infection. They are also useful in gene therapy. The present sequence is c. botulinum C2 enterotoxin translocation domain with botulinum neurotoxin type F (BONT/F) binding domain used in the exemplification of

Novel composition, comprising superoxide dismutase linked by a cleavable linker to a neuronal cell targeting component useful for delivering superoxide dismutase to neuronal cells to treat ischemia. WPI; 2000-376553/32.

Hallis B, Silman N;

Shone CC, Sutton JM,

Disclosure; Page 48-51; 65pp; English.

The present sequence represents a construct of the invention, comprising a manganese superoxide dismutase (Mn-SOD) polypeptide, a linker that can be cleaved by thrombin, and a heavy chain derived from botulinum neurotoxin serotype F. The specification describes a composition for heavy of SOD to neuronal cells. The composition comprises SOD linked, heavy clear the specification comprises SOD linked, heavy companies to the specification companies of SOD to neuronal cells. by a cleavable linker, to a neuronal cell targeting component (NCTC). This component has a domain that binds to a neuronal cell and a domain that translocates the SOD of the composition into the neuronal cell. "After translocation, the linker is cleaved to release the SOD. The composition is useful for treating neuronal diseases caused or augmented by oxidative stress, such as ischemic stroke, trauma, Parkinson's disease, Huntington's disease and motor neurone diseases
